

MEGANITE®

Project Health & Safety message relating to Meganite being free of Crystalline Silica Dust

An Australian Government Safety Warning has been issued in relation to the dangers associated with exposure to Crystalline Silica dust, which is contained in several stone products.

Crystalline Silica dust is a workplace byproduct generated in the mechanical processing of stone based products including engineered stone.

Inhalation of Silica dust may lead to serious health issues, particularly if inhalation occurs repeatedly over time. As a result of widespread health concerns affecting the engineered stone processing industry, major class action lawsuits are emerging globally.

As an Acrylic Solid Surface, MEGANITE is 100% Silica-free. It does not contain Crystalline Silica nor is it used in any part of the manufacturing process. Meganite does not present these same critical exposure issues making it a safe alternative to engineered stone.

MEGANITE brand Solid Surface is GreenGuard and NSF-51 Certified, meaning it is an ideal surface for use in food preparation and service applications.

For more information about the Government Safety Warning, please refer to SAFE WORK AUSTRALIA at www.safeworkaustralia.gov.au/silica
